

REASONS TO UPGRADE TO TEXPRINT - V16

In addition to the developing printing technologies, there have been some developments that have had a positive and forward-looking effect on the sublimation printing industry. RIP program, which is one of the main parameters of the sector, continues to exist by developing.

For this reason, the main reasons for the forced transition to the V-16 are:

- 1-) With V-16, you now have an original software and all kinds of support, solutions, developments and updates are guaranteed by ERGOSOFT.
- 2-) With the original software support, your computer is now more secure. Because you cannot install antivirus software in the texprints you are currently using. It prevents some parameters in the program from working.
- 3-) It brings the feature of keeping your computer up to date. Especially after switching to windows 10, the self-update of the computer in terms of security causes the program you are using now to fail and reload.
- 4-) It enables the use of different drop sizes in the carpet industry. Instead of the old program that normally uses 3 drop sizes (large, medium, small) and therefore more tiring, it allows the use of less tiring (large and middle) drop sizes instead of the old program that puts less stress on the mind.
- 5-) When it comes to ripping, V16 provides faster transfer than before.
- 6-) There are many innovations in color fastening and profiling. It has advantages especially in creating black color.
- 7-) The EYE-ONE devices that we use for profiling are now about to expire. The necessity of switching to new type (PRO-3) devices has arisen. These new types of devices are not supported by the old program you are currently using. Therefore, it has become somewhat mandatory to switch to the new program. Old program profiles will not be able to be made to new devices.
- 8-) Texprint 14 will not work in future versions of Windows. (Ex: Windows 11)
